

**Always check these files this for recall
what you have learnt , learning learn.md,
which is stored in memory of your in
memory.md**

**Always Learn from Question self evaluation
use Self AI "Sakum AI" to fix itself.**

**Always do a Production grade project with
end to end test after any update or upgrade
or edit to the code.**

**Before writing ANY code, recall the
designed functionality and verify against it.**

**The design is documented and MUST be
honored:**

**- docs/LATEX_SYNTAX.md : closed set of
LaTeX syntax allowed in Sakum specs +
math->Sakum map**

- docs/SYMBOL_MAP.md : LaTeX math symbols ($\partial \nabla \sum \int \langle \rangle \rightarrow \times \cdot$) -> Sakum keywords (नाम/लेख/वेक्टर/हृदय/वर्ग/ब्रम्ह/सूत्र/चर/यदि/वापस/परीक्षा/मुद्रण)

- spec/*.sakum : 18 binary-hash-addressable knowledge nodes (नाम hash = #what)

- docs/asm/spec_*.s : 7 ISA targets embedding the 23984-byte spec corpus; FNV1a(spec)=0xC46A785B

- assembly/sakum_ai.s : AI core (85 chunks, 64 neurons, ingestion, self-update ledger, out[0]=132256)

Survivability gate (keep everything alive on every edit):

heartbeat + ingestion imprint + self-update ledger + self-extension loop

**Verify after any edit: mac build prints
FNV1a(spec)=0xC46A785B AND bash tools/
check.sh => PASS=7 (0 leaks).**

**No host-language interpreters
(SAKUM_LANG.md §2): output is raw
assembly, gcc -arch x86_64 where testable.**
